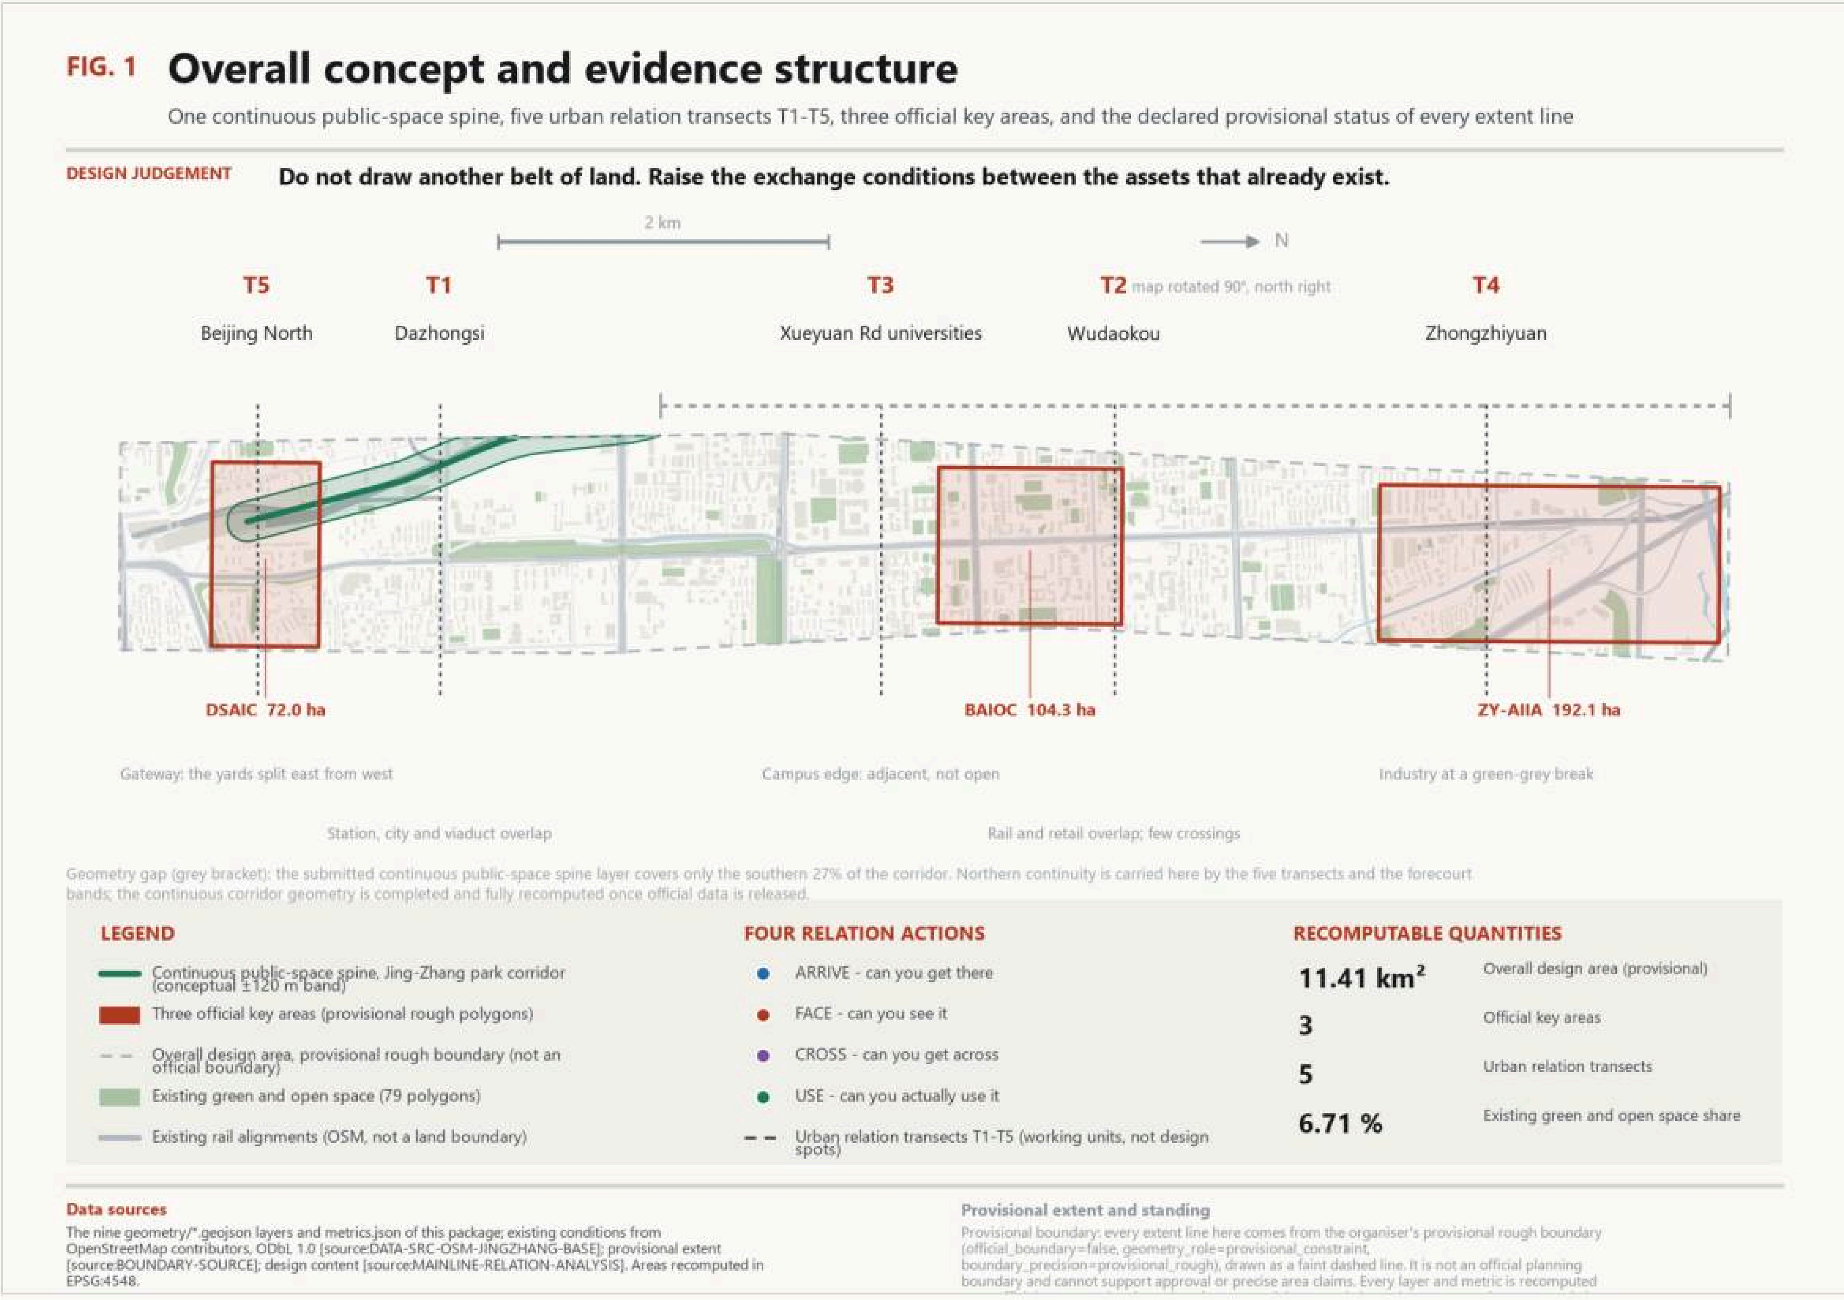
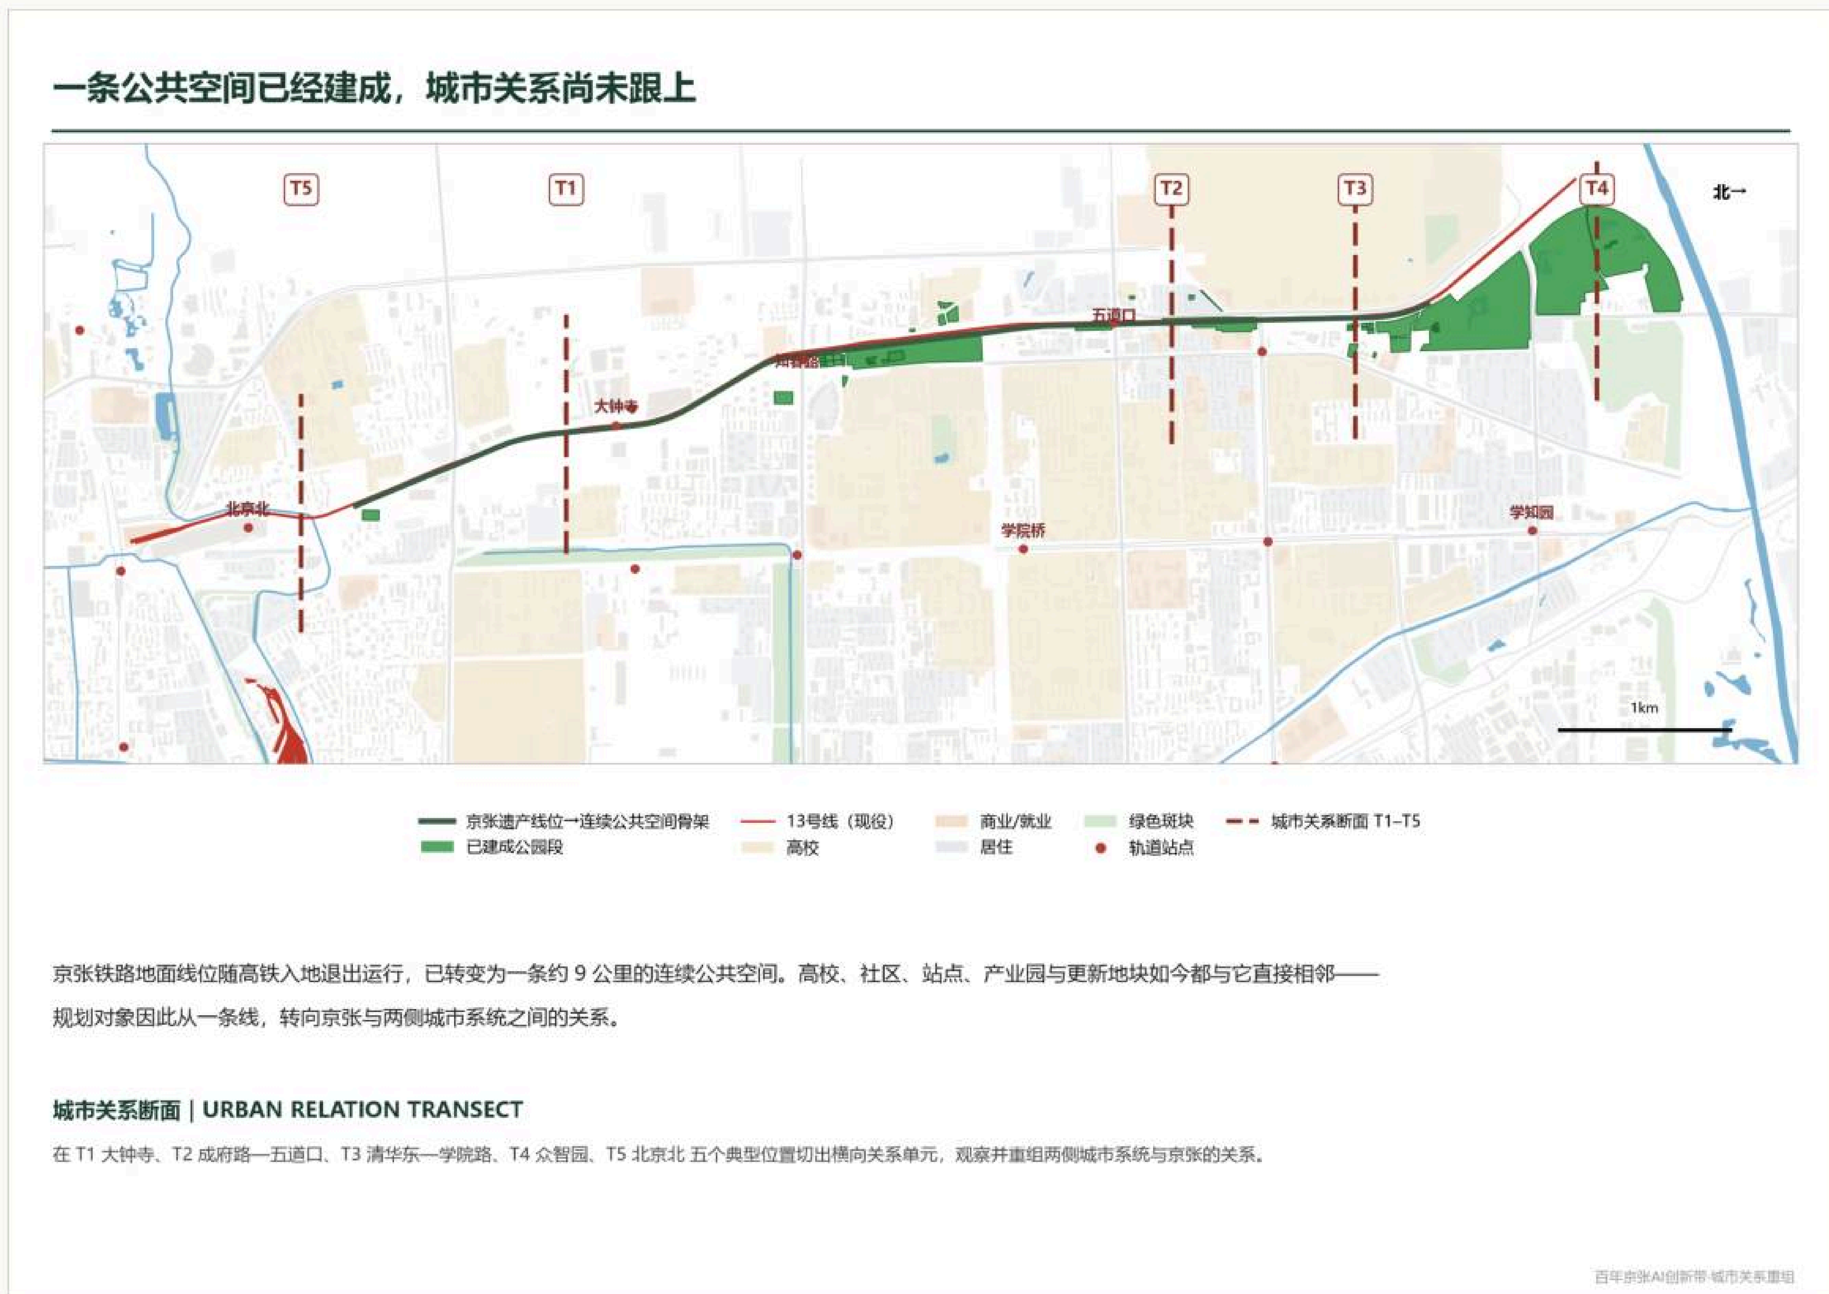
Board 1 - Overall design structure

Do not draw another belt of land: one continuous public-space spine and five urban relation transects raise the exchange conditions between assets that already exist.



Overall concept and evidence structure, derived from this package's GeoJSON and metrics

Overall structure plan: the spine, the lateral connections, the three key areas and the gateways

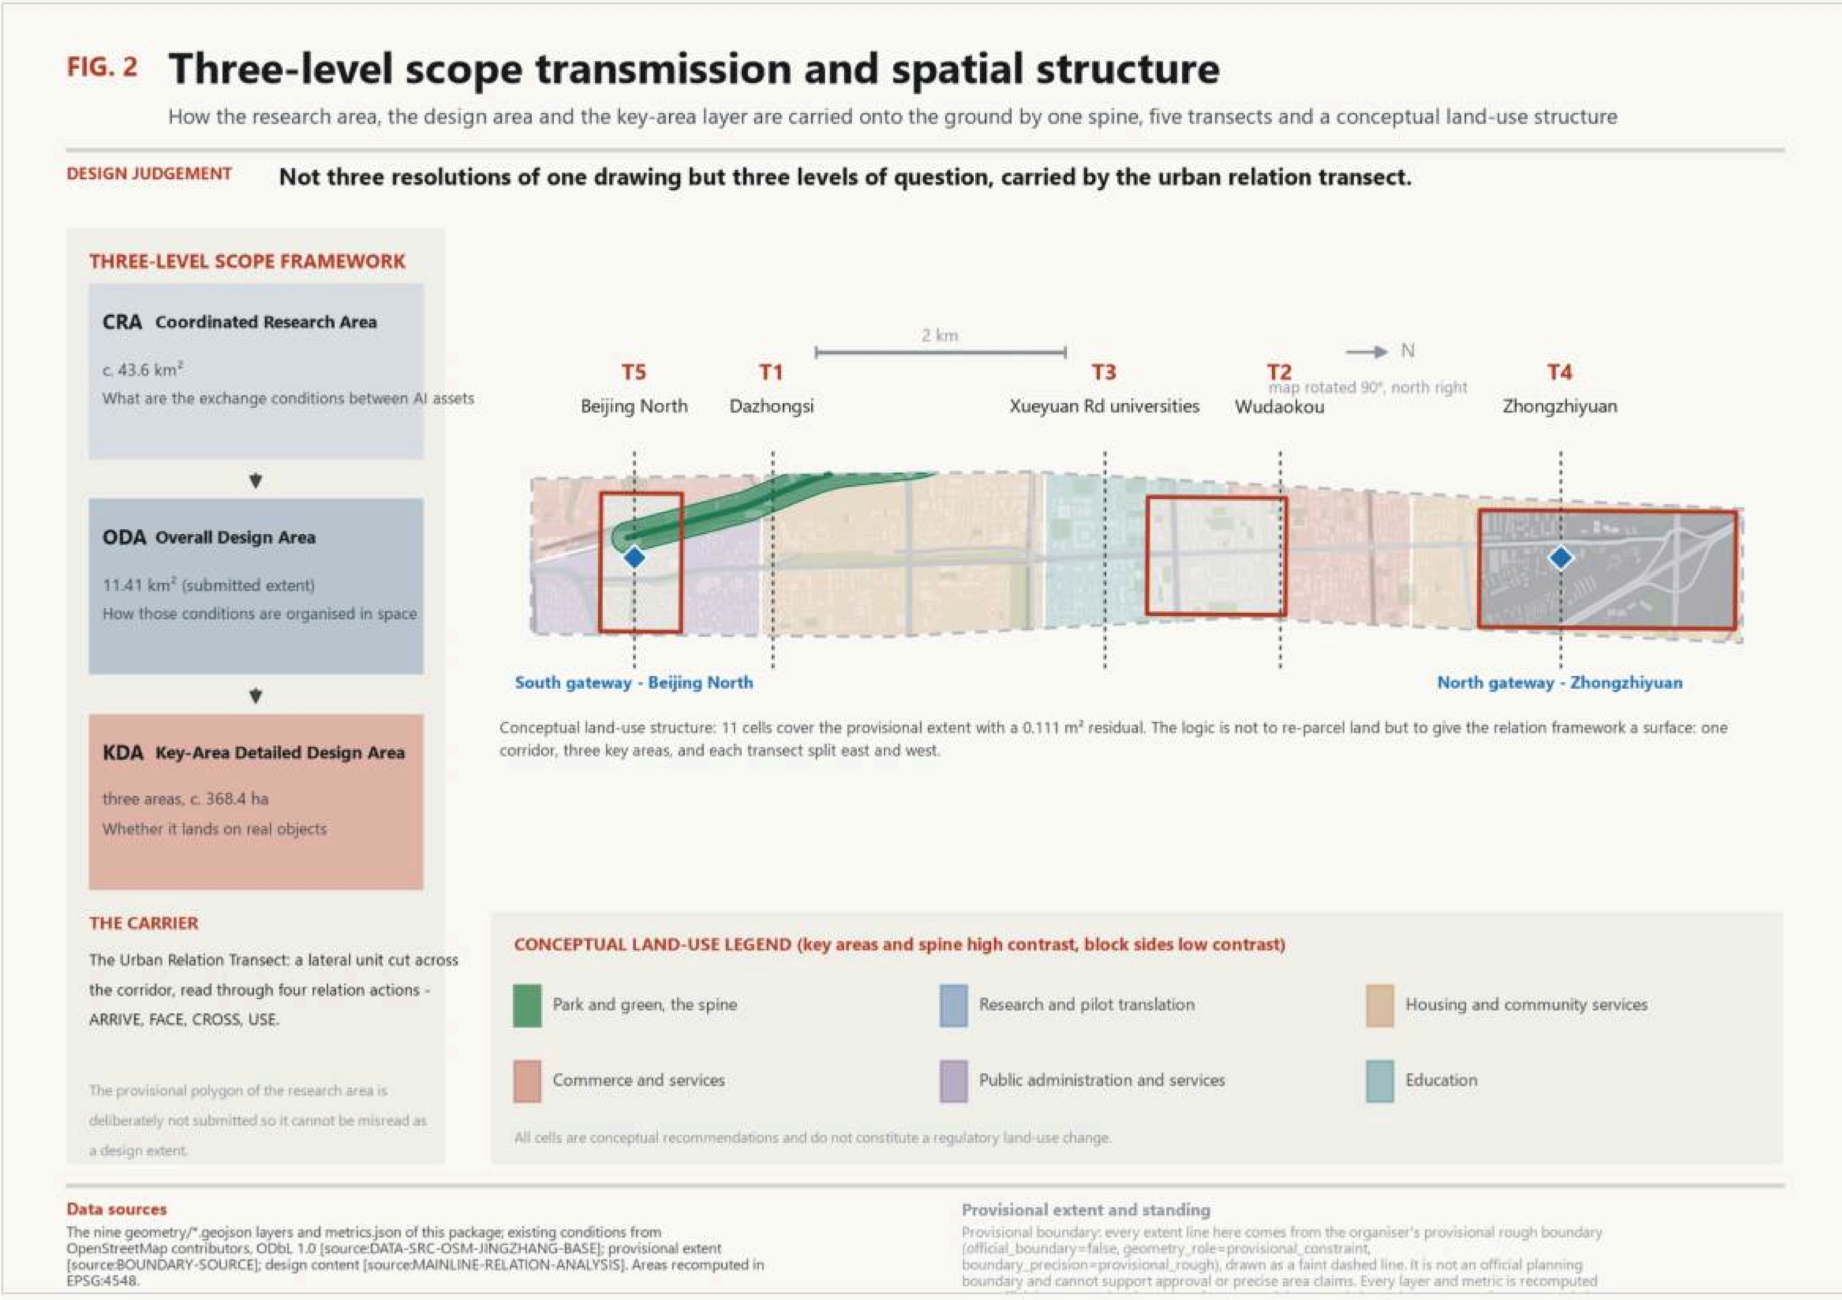


The proposition: relation lag along the corridor

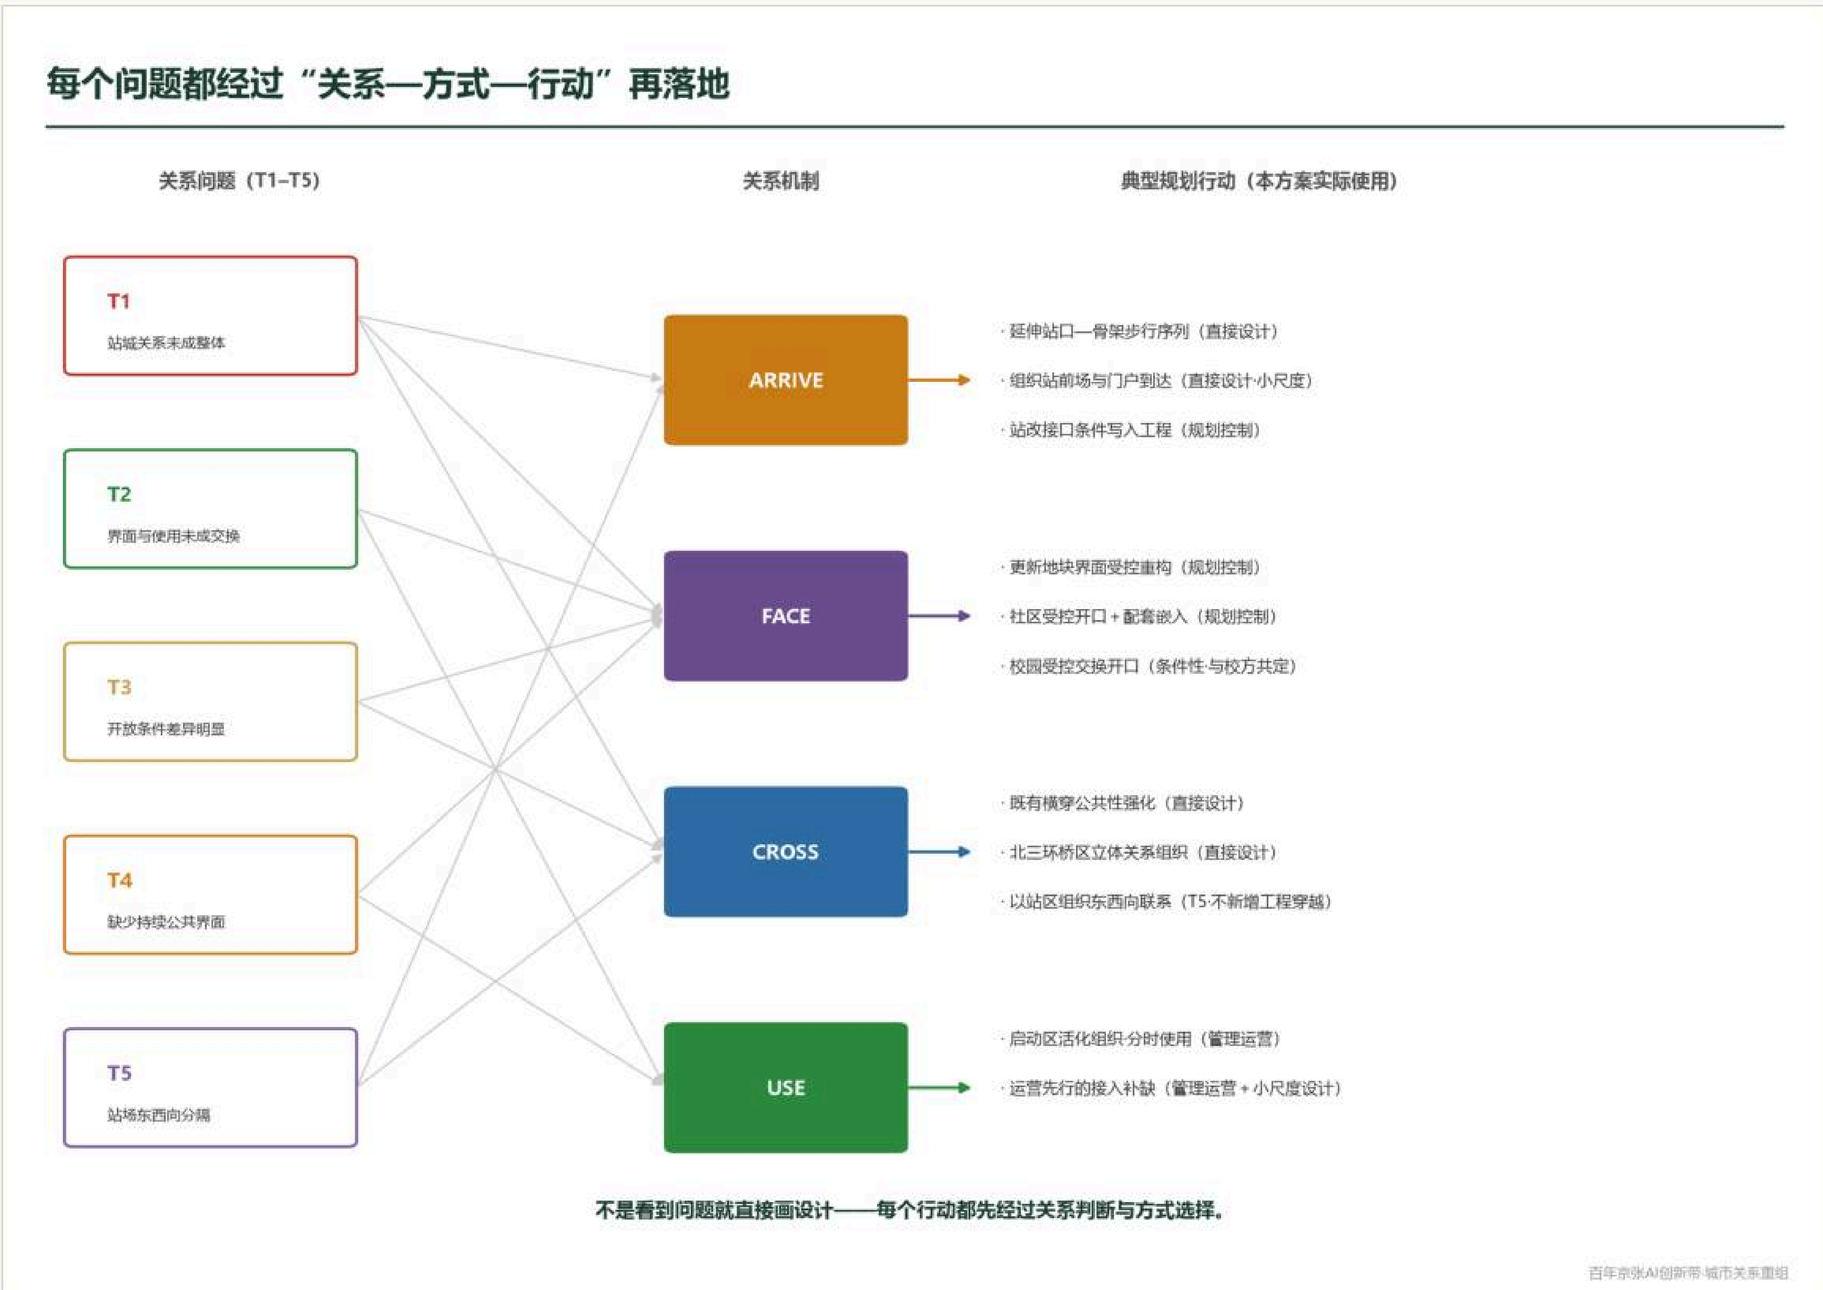
Data sources: this package's geometry/*.geojson and metrics.json; existing conditions from OpenStreetMap contributors under ODbL 1.0; provisional extent from brief/site-package/geometry/provisional_boundaries.geojson; design content from the entrant's own relation analysis. Areas recomputed in every spatial proposal is a conceptual recommendation, a reference scheme or material for a professional team to develop; the extent is a provisional rough boundary (official_boundary=false), not an official planning boundary, and cannot support approval or precise area claims; no government comm event, secured investment or committed construction is claimed.

Board 2 - Land use and urban renewal

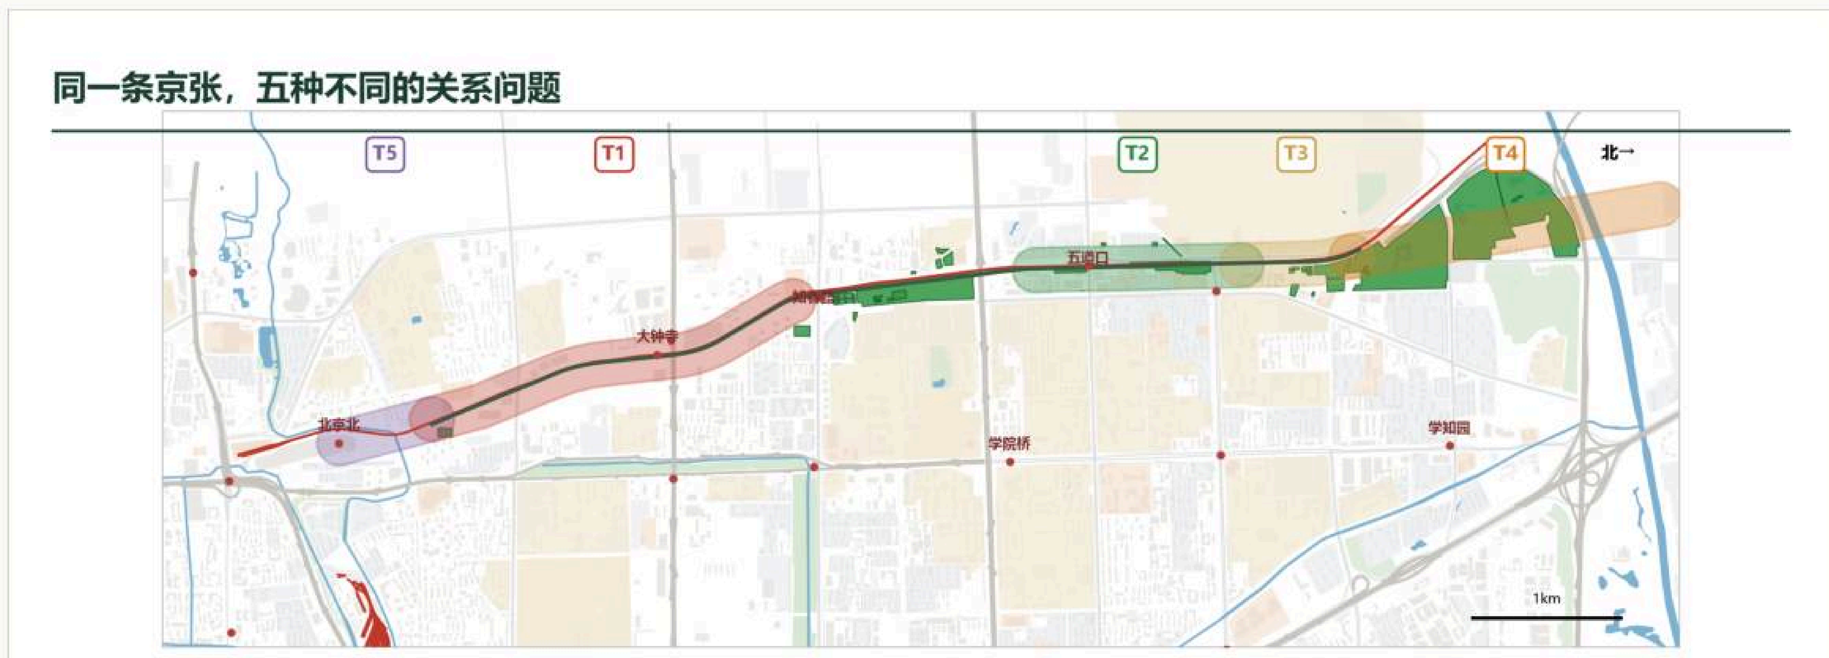
The zoning logic is not to re-parcel land but to give the relation framework a surface; renewal projects are organised by relation action, not by parcel.



Three-level scope transmission and the conceptual land-use structure (11 cells covering the provisional extent)



From problem to mechanism to action: where the twelve renewal projects come from



断面	真正的问题	关系重点		
T1 大钟寺	站点、更新地块与京张已经高度相邻，但到达、换层和横向公共关系仍未形成整体	ARRIVE	FACE	CROSS
T2 成府路—五道口	高校、创新资源与公共空间相邻，但界面与使用组织尚未形成稳定交换	FACE	USE	
T3 清华东—学院路	高校边界开放条件差异明显，公共交换取决于管理边界与横穿条件	FACE	CROSS	
T4 众智园	产业、绿地与城市日常空间各自运行，缺少持续的公共界面关系	FACE	USE	
T5 北京北	站场与铁路设施造成东西向分隔，京张端点尚未形成连接两侧城市、组织到达的门户节点	ARRIVE	CROSS	

百年京张AI创新带·城市关系重组

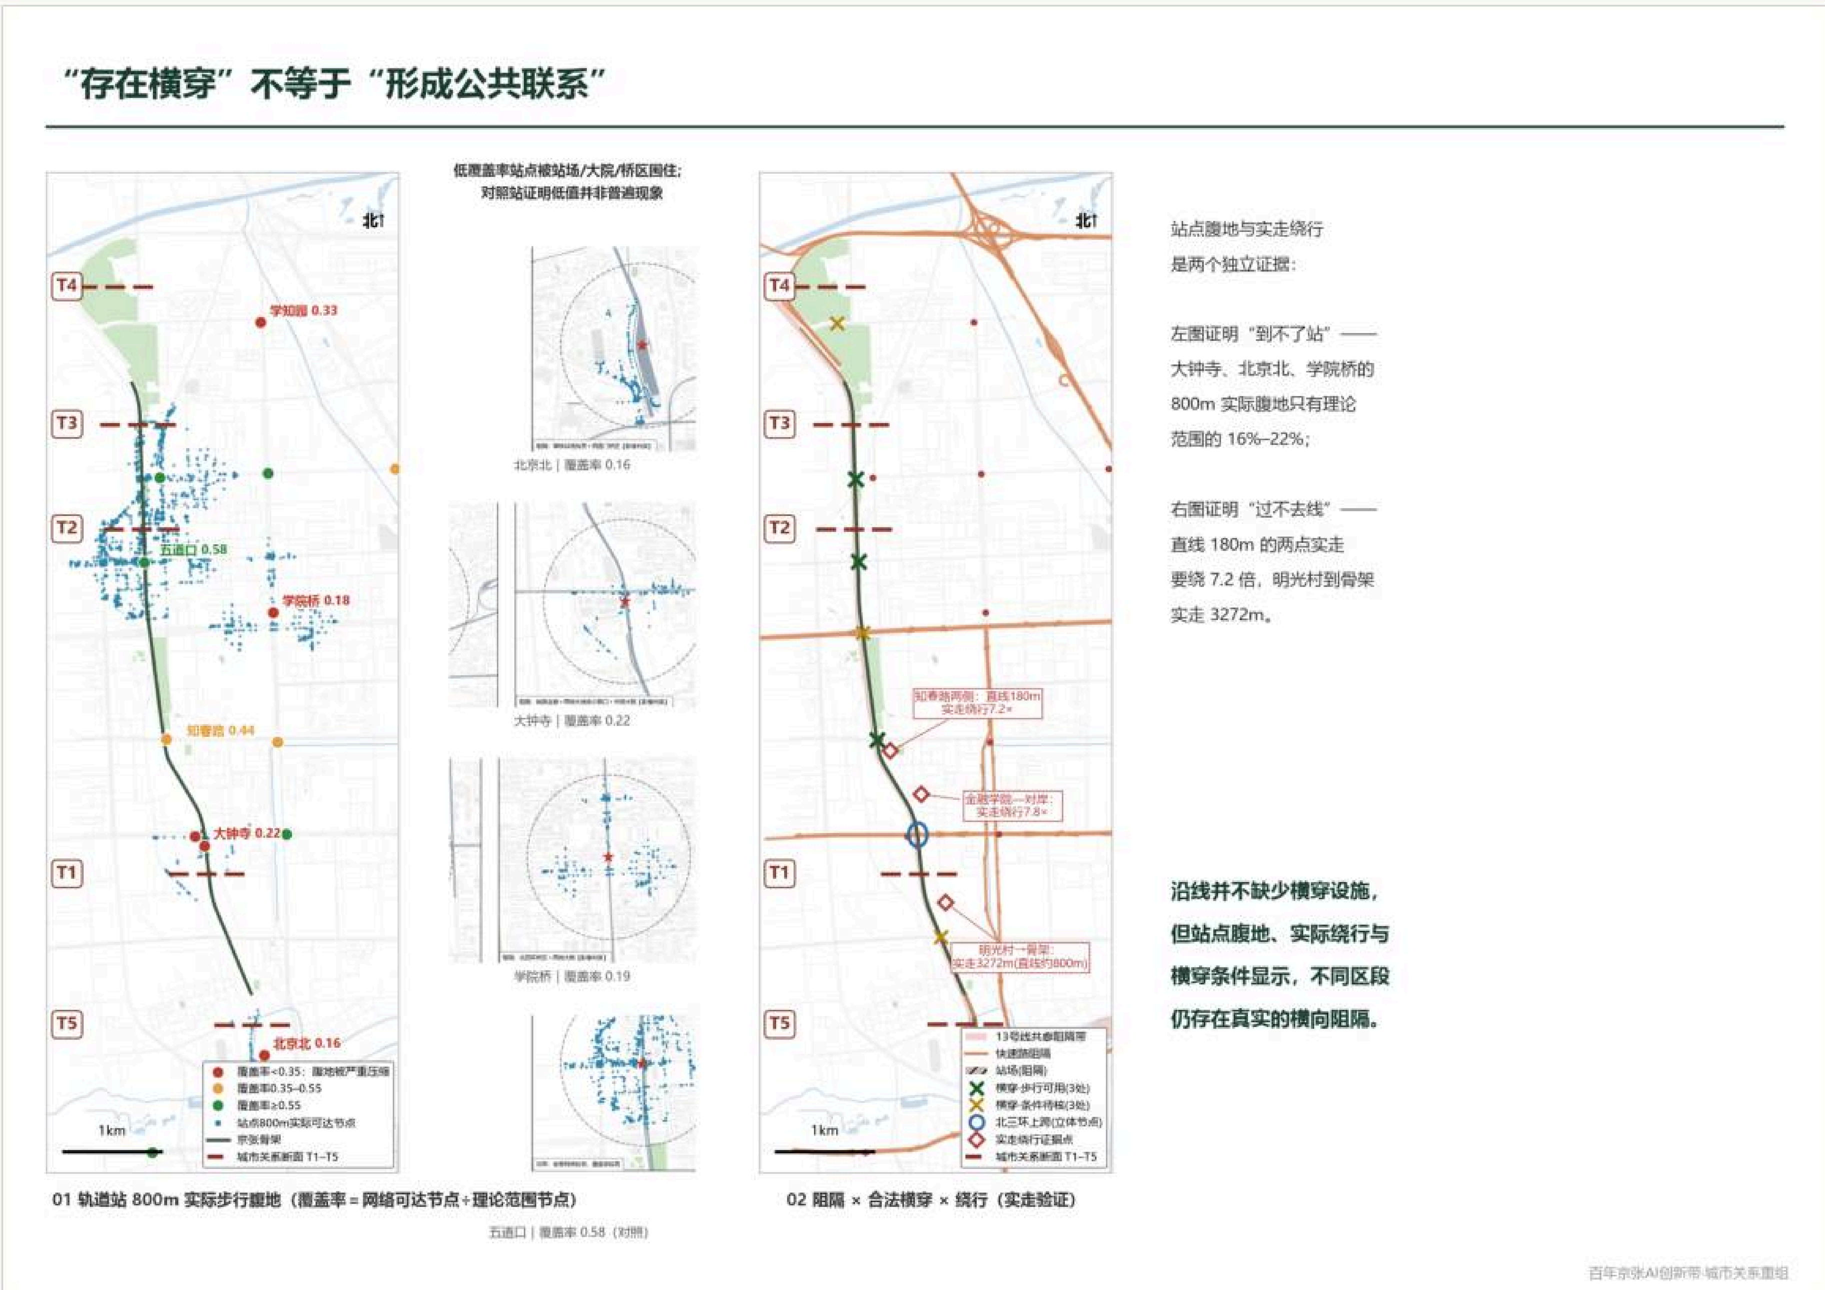
Five transects: problem index and role matrix

Data sources: this package's geometry/*.geojson and metrics.json; existing conditions from OpenStreetMap contributors under ODbL 1.0; provisional extent from brief/site-package/geometry/provisional_boundaries.geojson; design content from the entrant's own relation analysis. Areas recomputed in every spatial proposal is a conceptual recommendation, a reference scheme or material for a professional team to develop; the extent is a provisional rough boundary (official_boundary=false), not an official planning boundary, and cannot support approval or precise area claims; no government comm event, secured investment or committed construction is claimed.

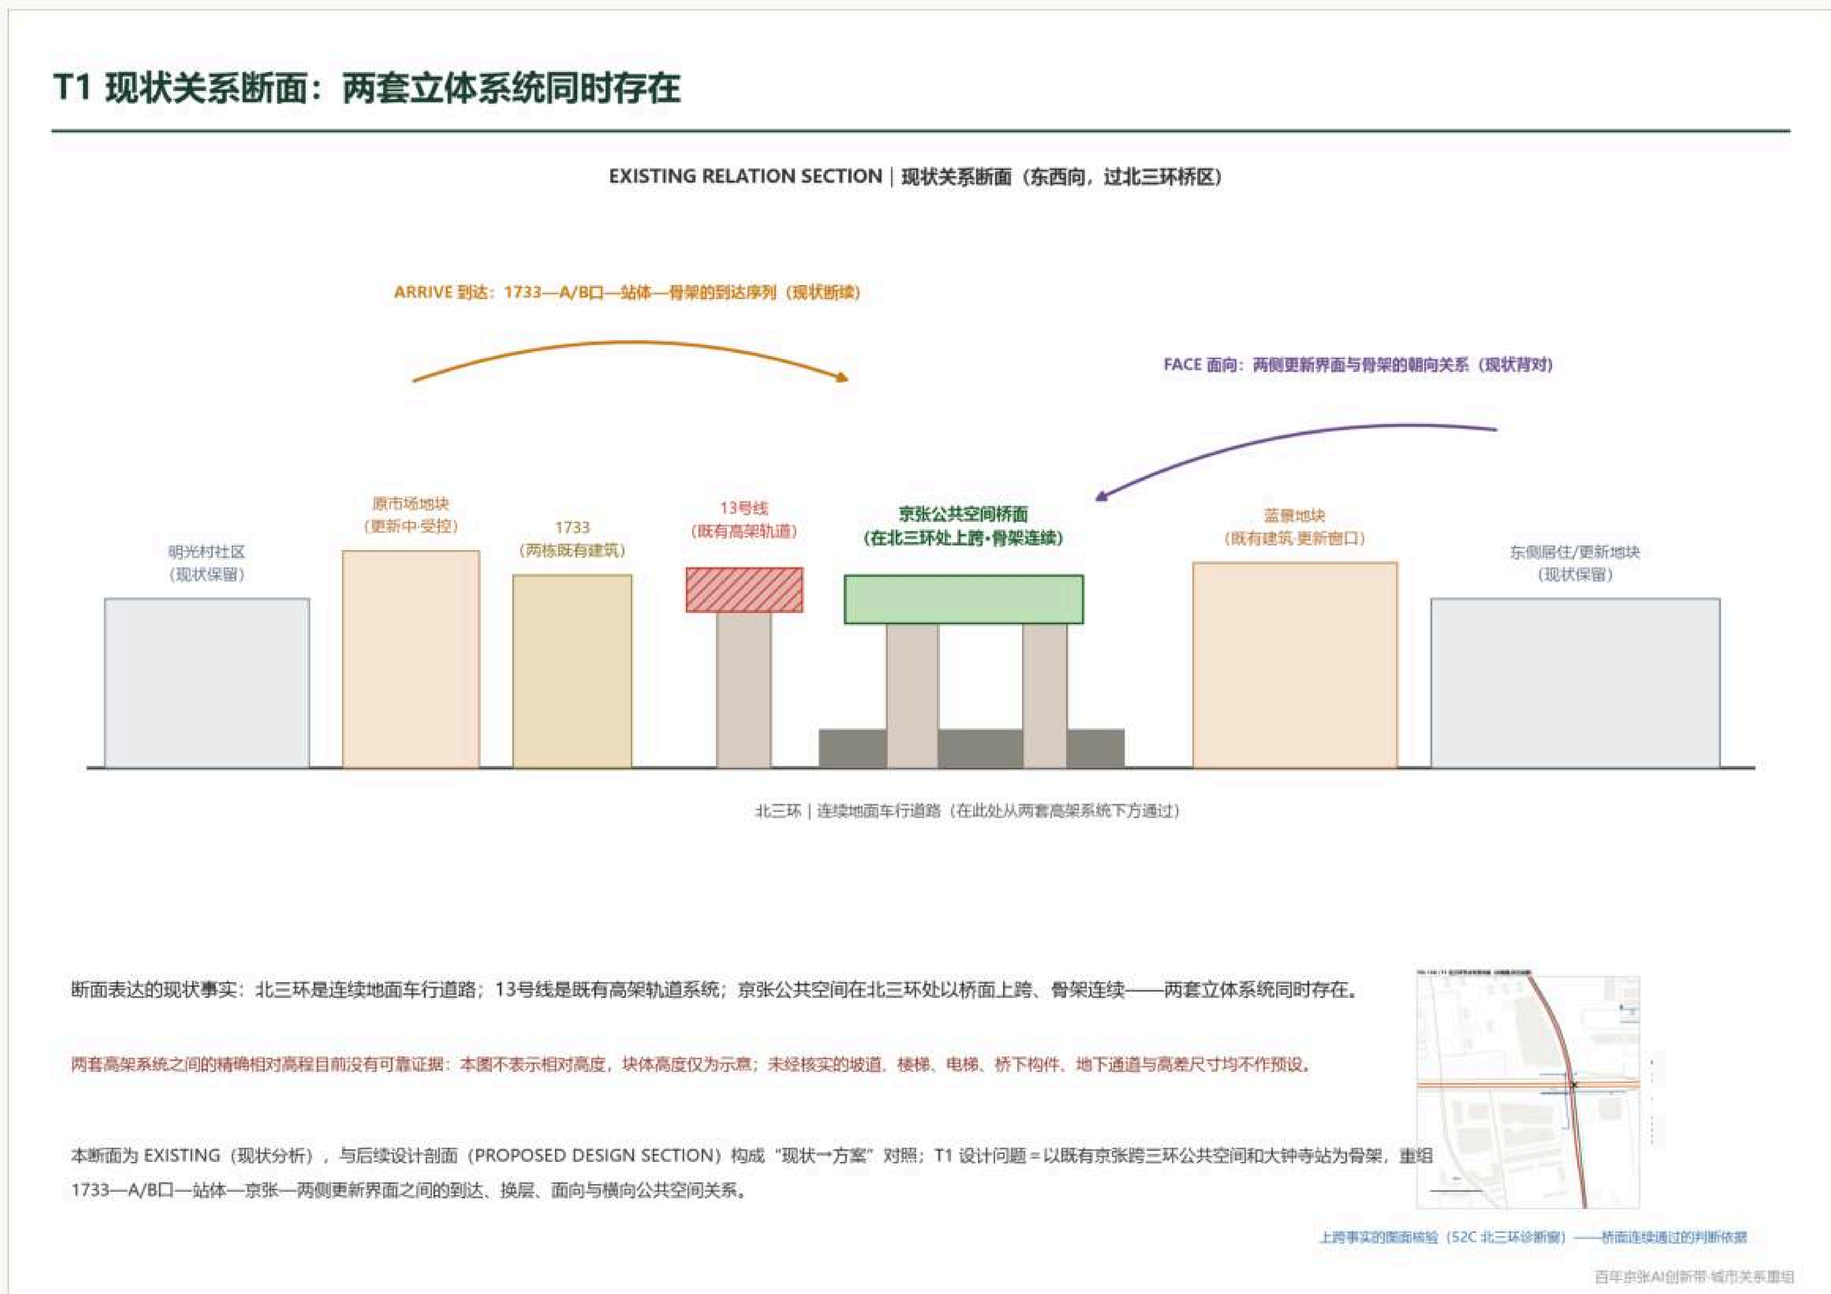
Board 3 - Transport, rail, walking and utilities

Stations are dense, arrival is not; the line is continuous, crossing it is not. What is added is paths and frontages, not more facilities, and no alignment conclusion is drawn.

Grey infrastructure: network and barrier in one body; crossings in three verification states



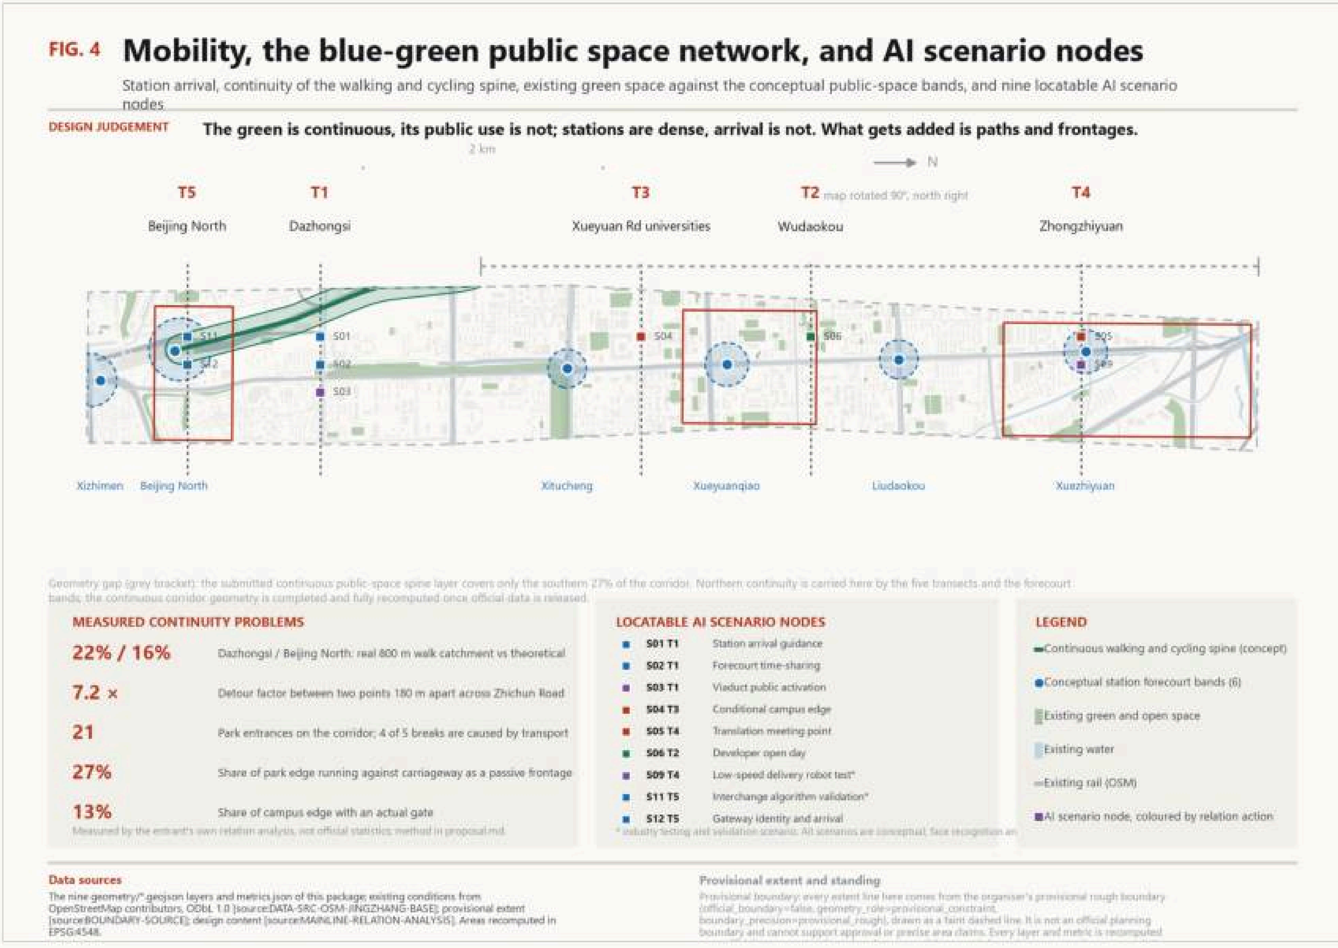
Station catchment against barrier, crossing and measured detour



Existing section and the North 3rd Ring window; the relative levels of the two elevated systems are unverified

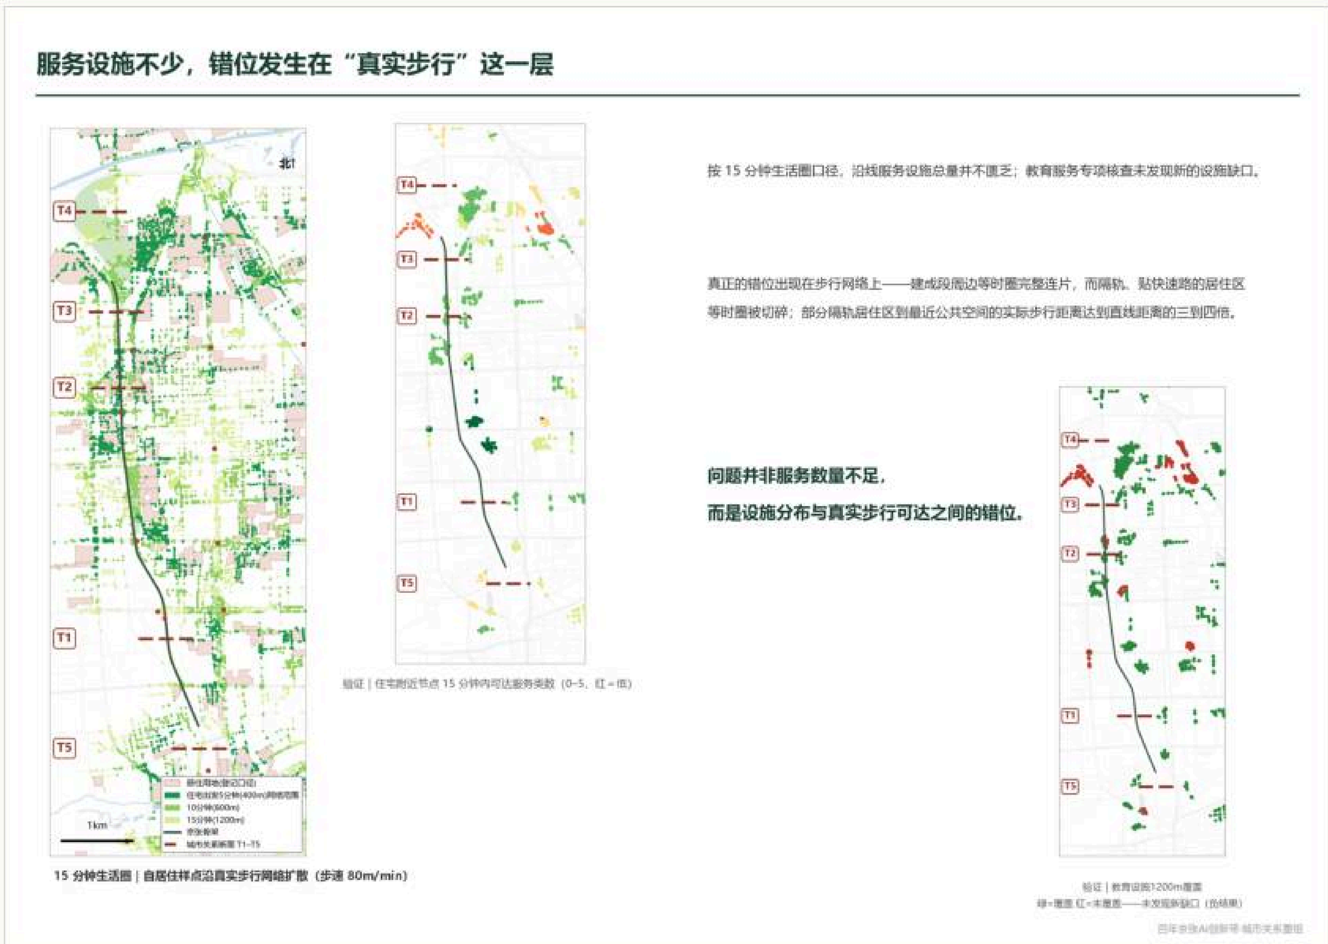
Board 4 - The Jing-Zhang park activity belt and blue-green public space

Ecological continuity is not continuity of public use: the point is not more green but turning the existing ecological frame into public space that can be entered, reached and used.

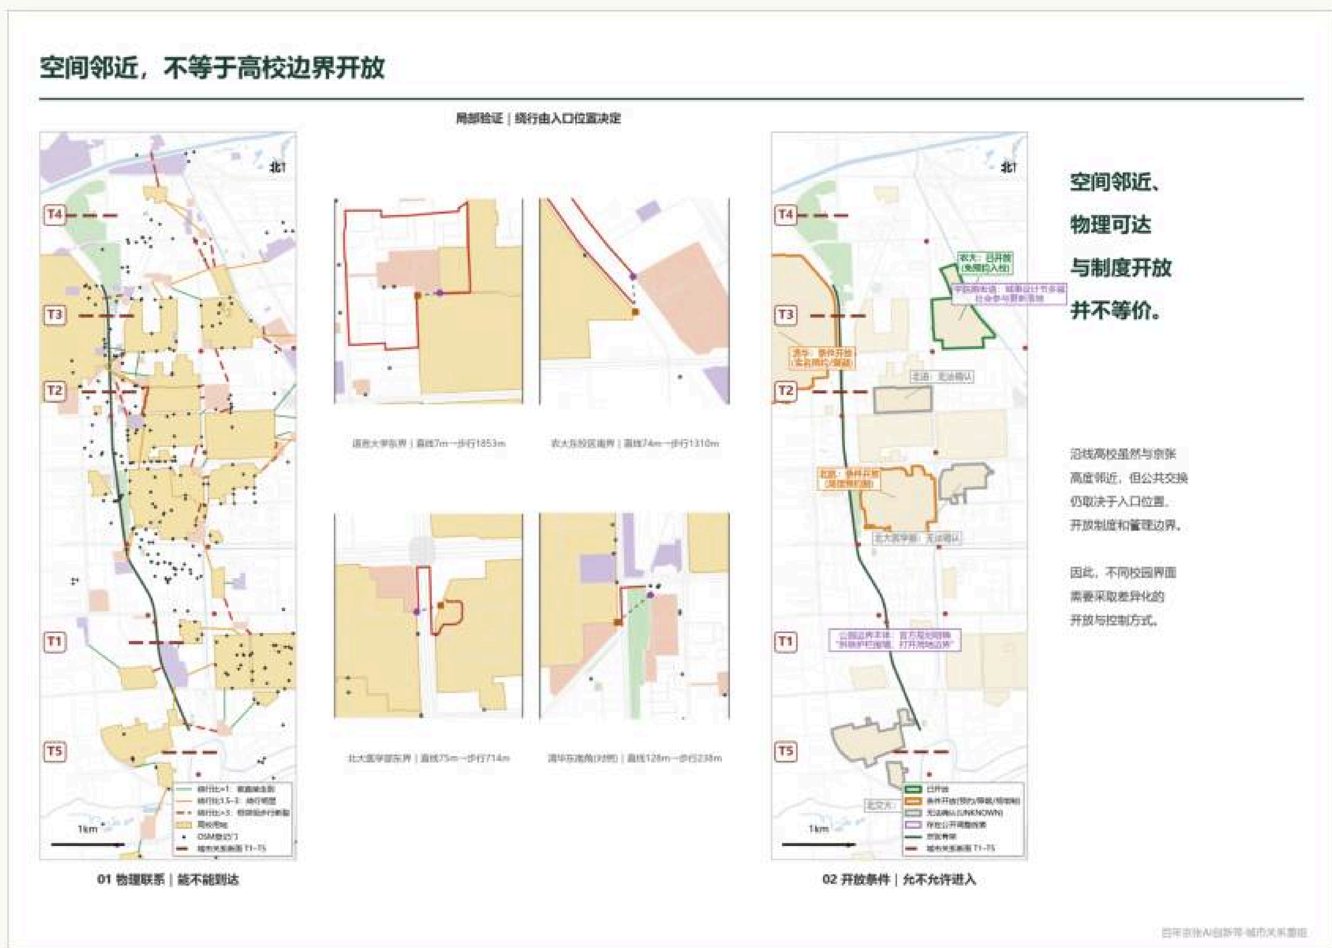


Mobility, blue-green public space and locatable AI scenario nodes

Two continuities: structural continuity beside walked access



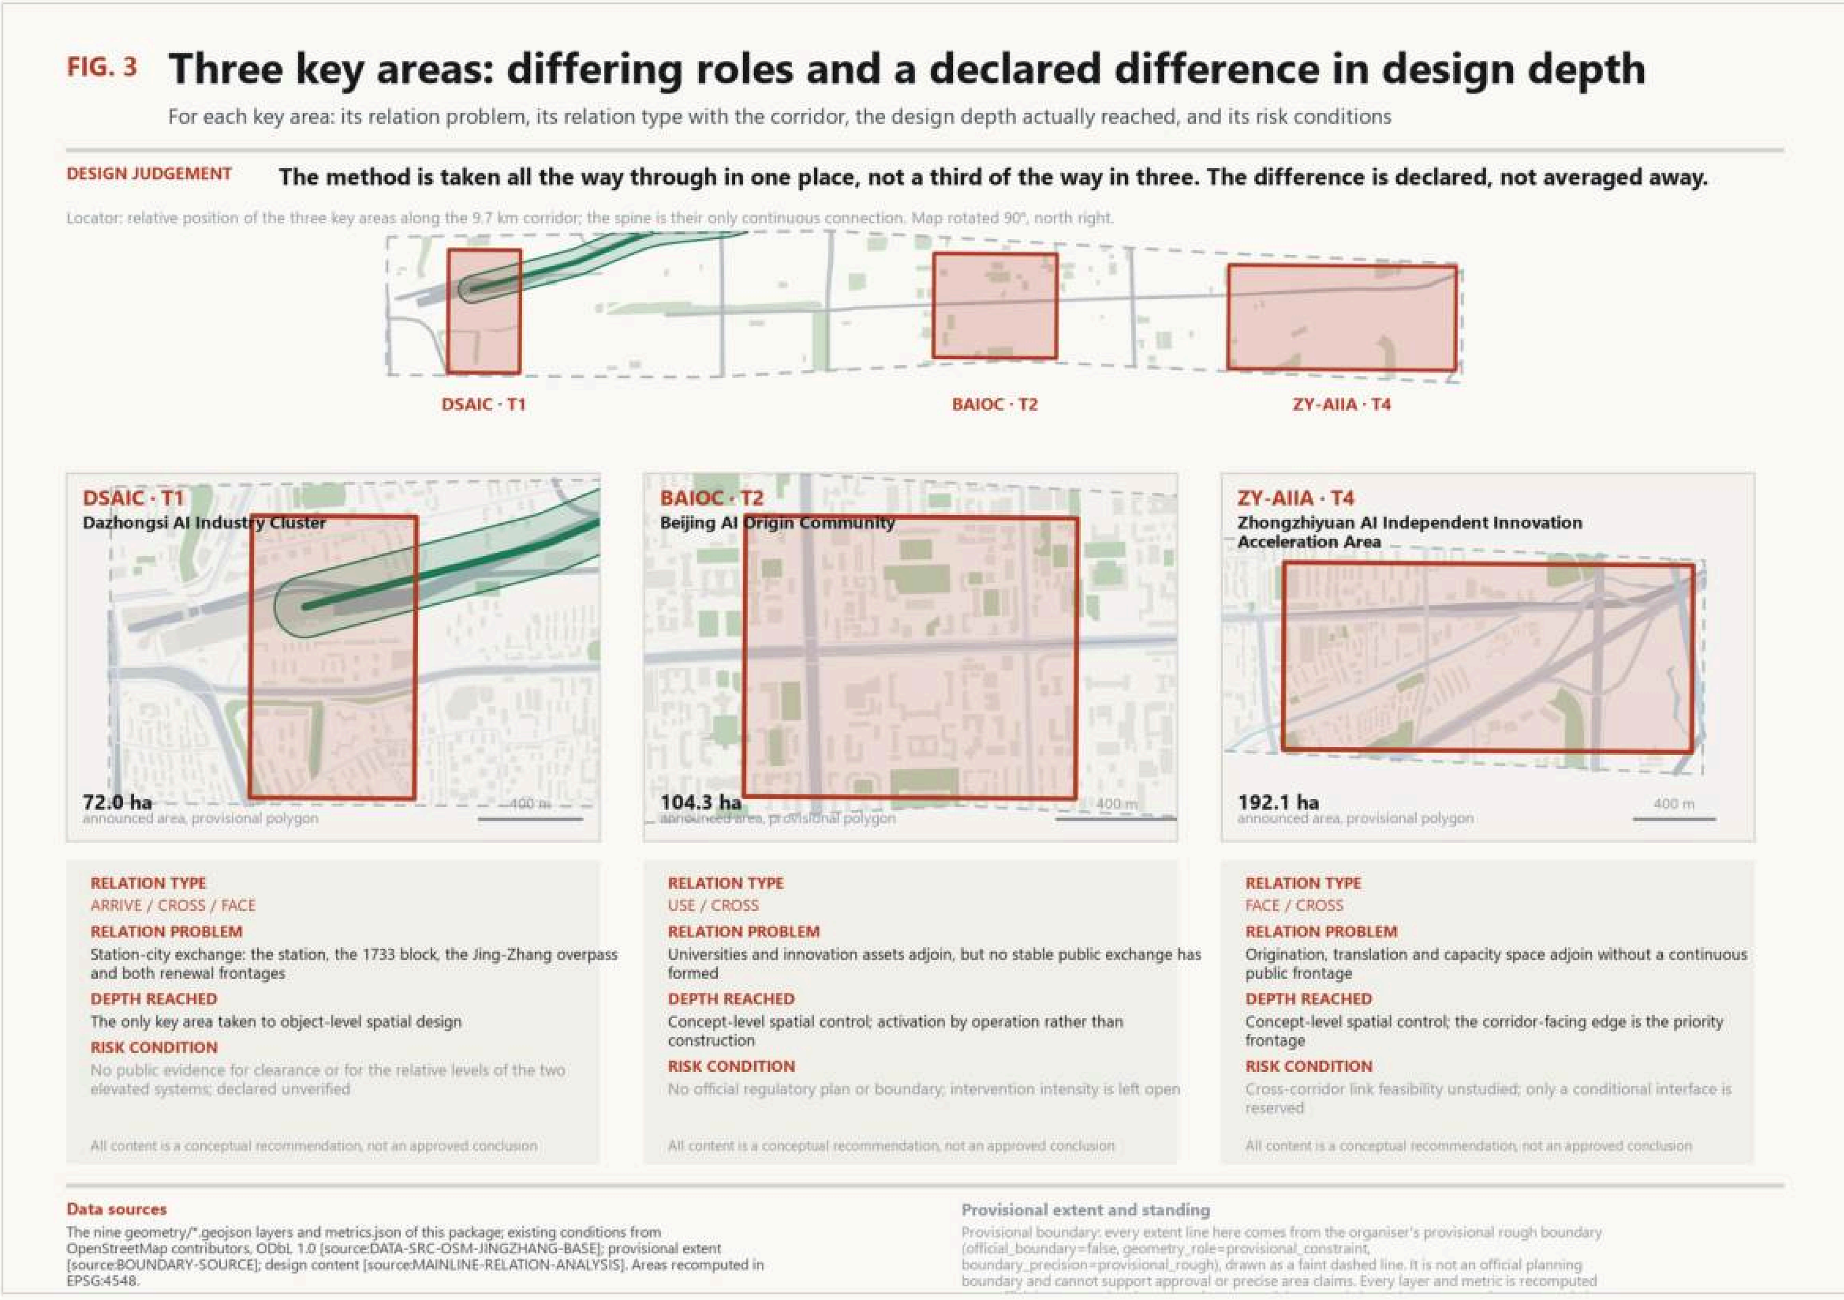
15-minute access, everyday services and the education negative result



Campus walkability and access rules: physical access is not institutional openness

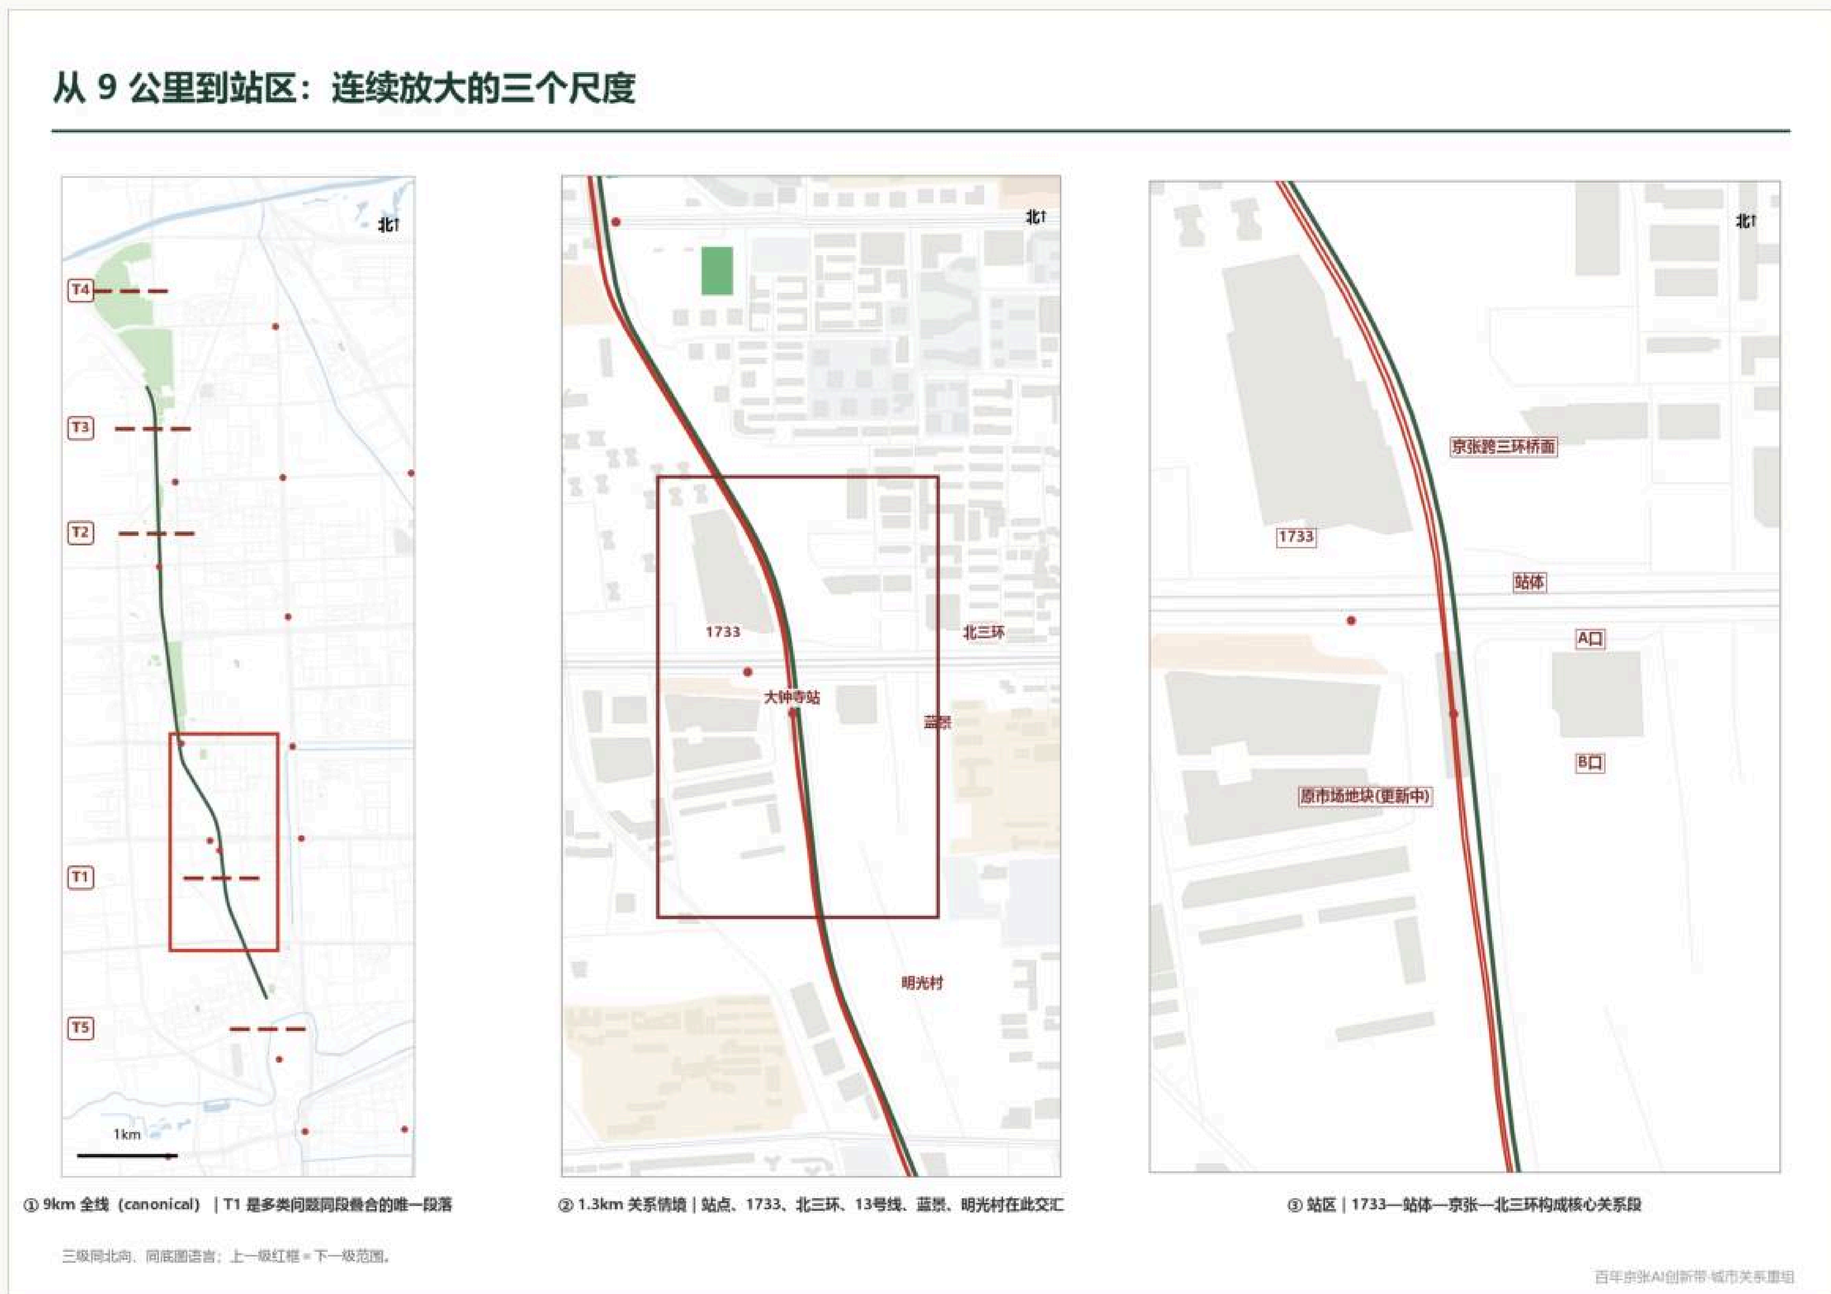
Board 5 - Detailed design of the three key areas

The method is taken all the way through in one place, Dazhongsi, rather than a third of the way in three; the difference in depth is declared, not averaged away.



The three key areas: differing roles and the declared difference in design depth

T1 Dazhongsi: the fact base and its strict three-way inventory

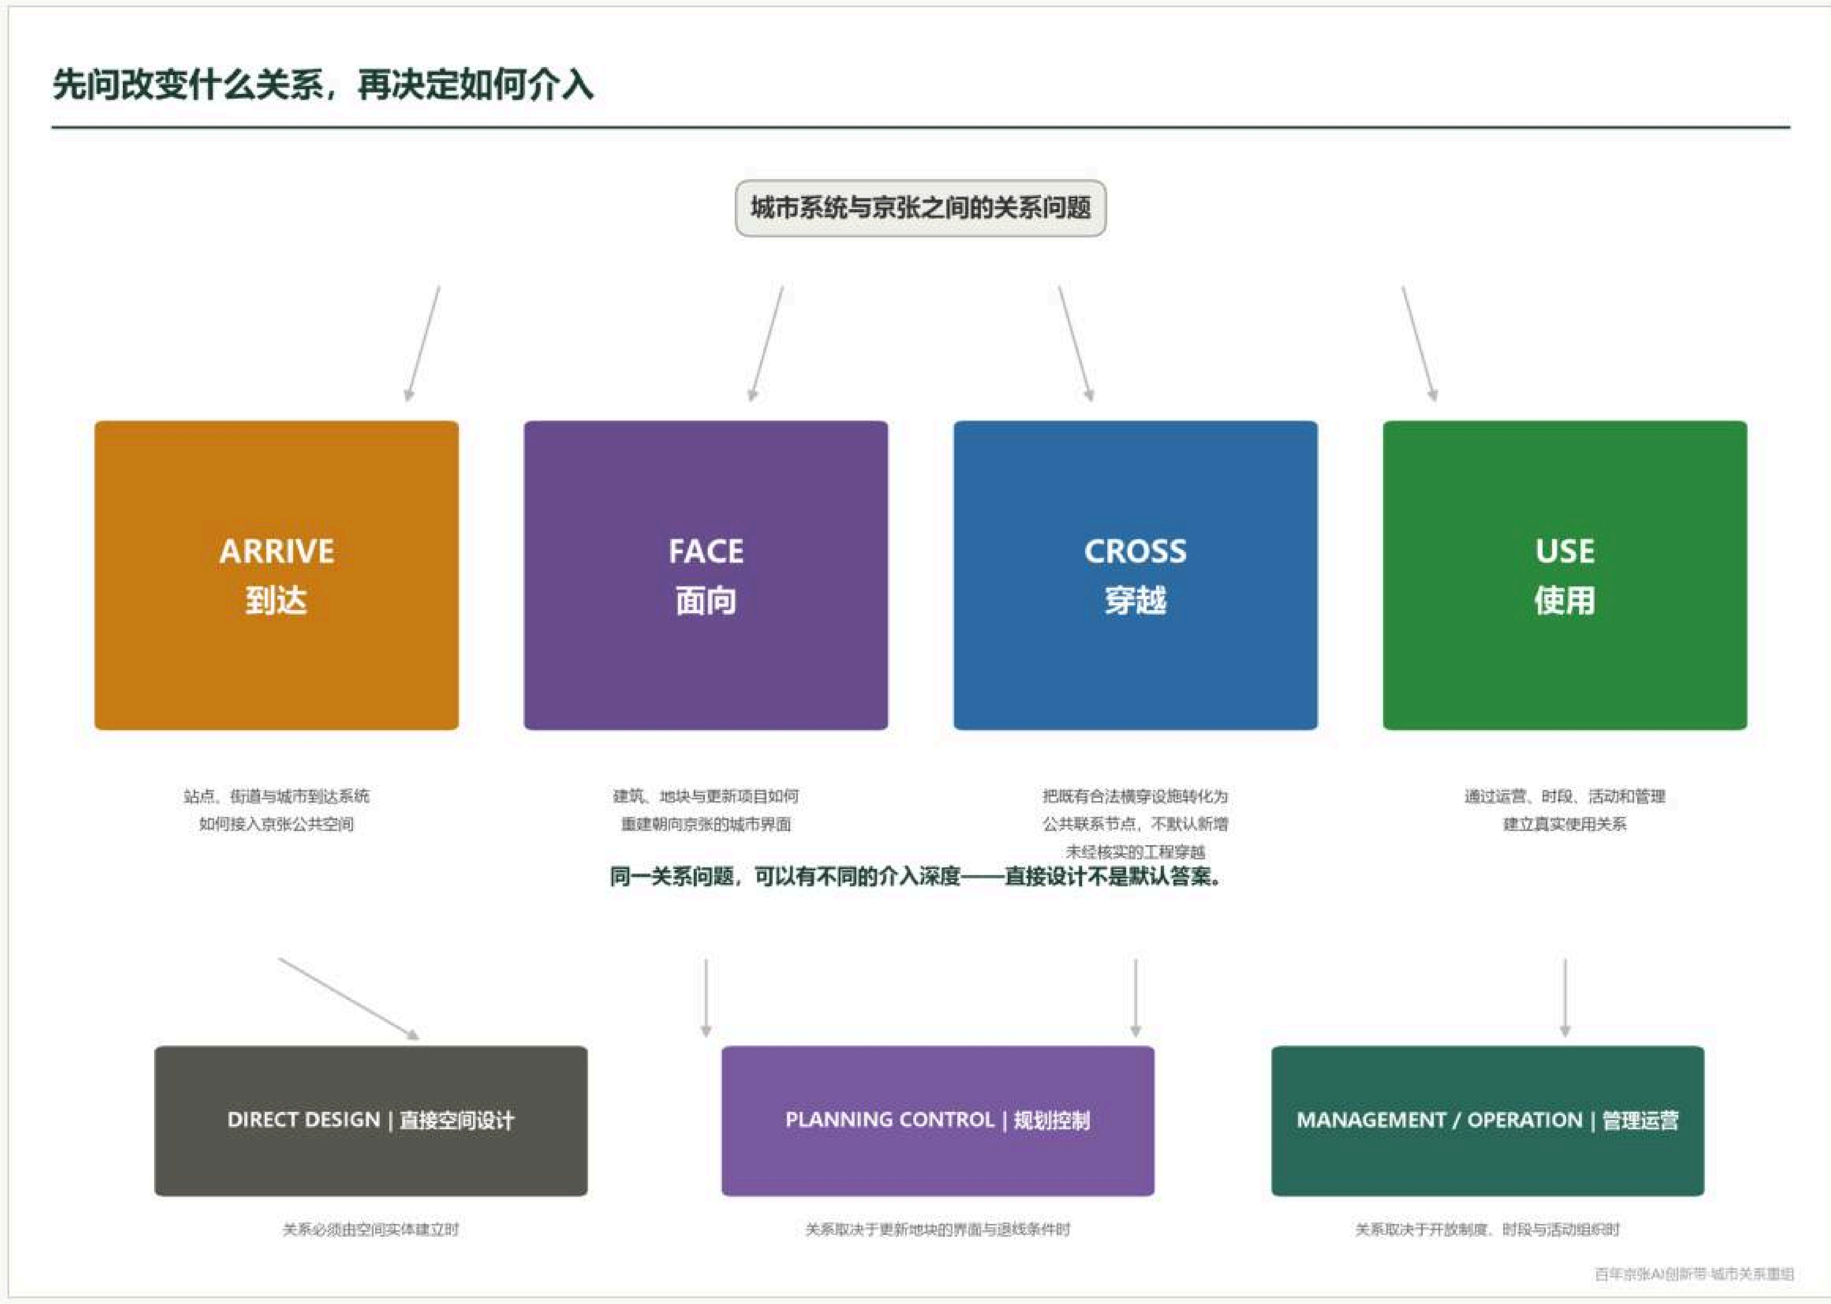


Scale transmission: overall area to transect to object

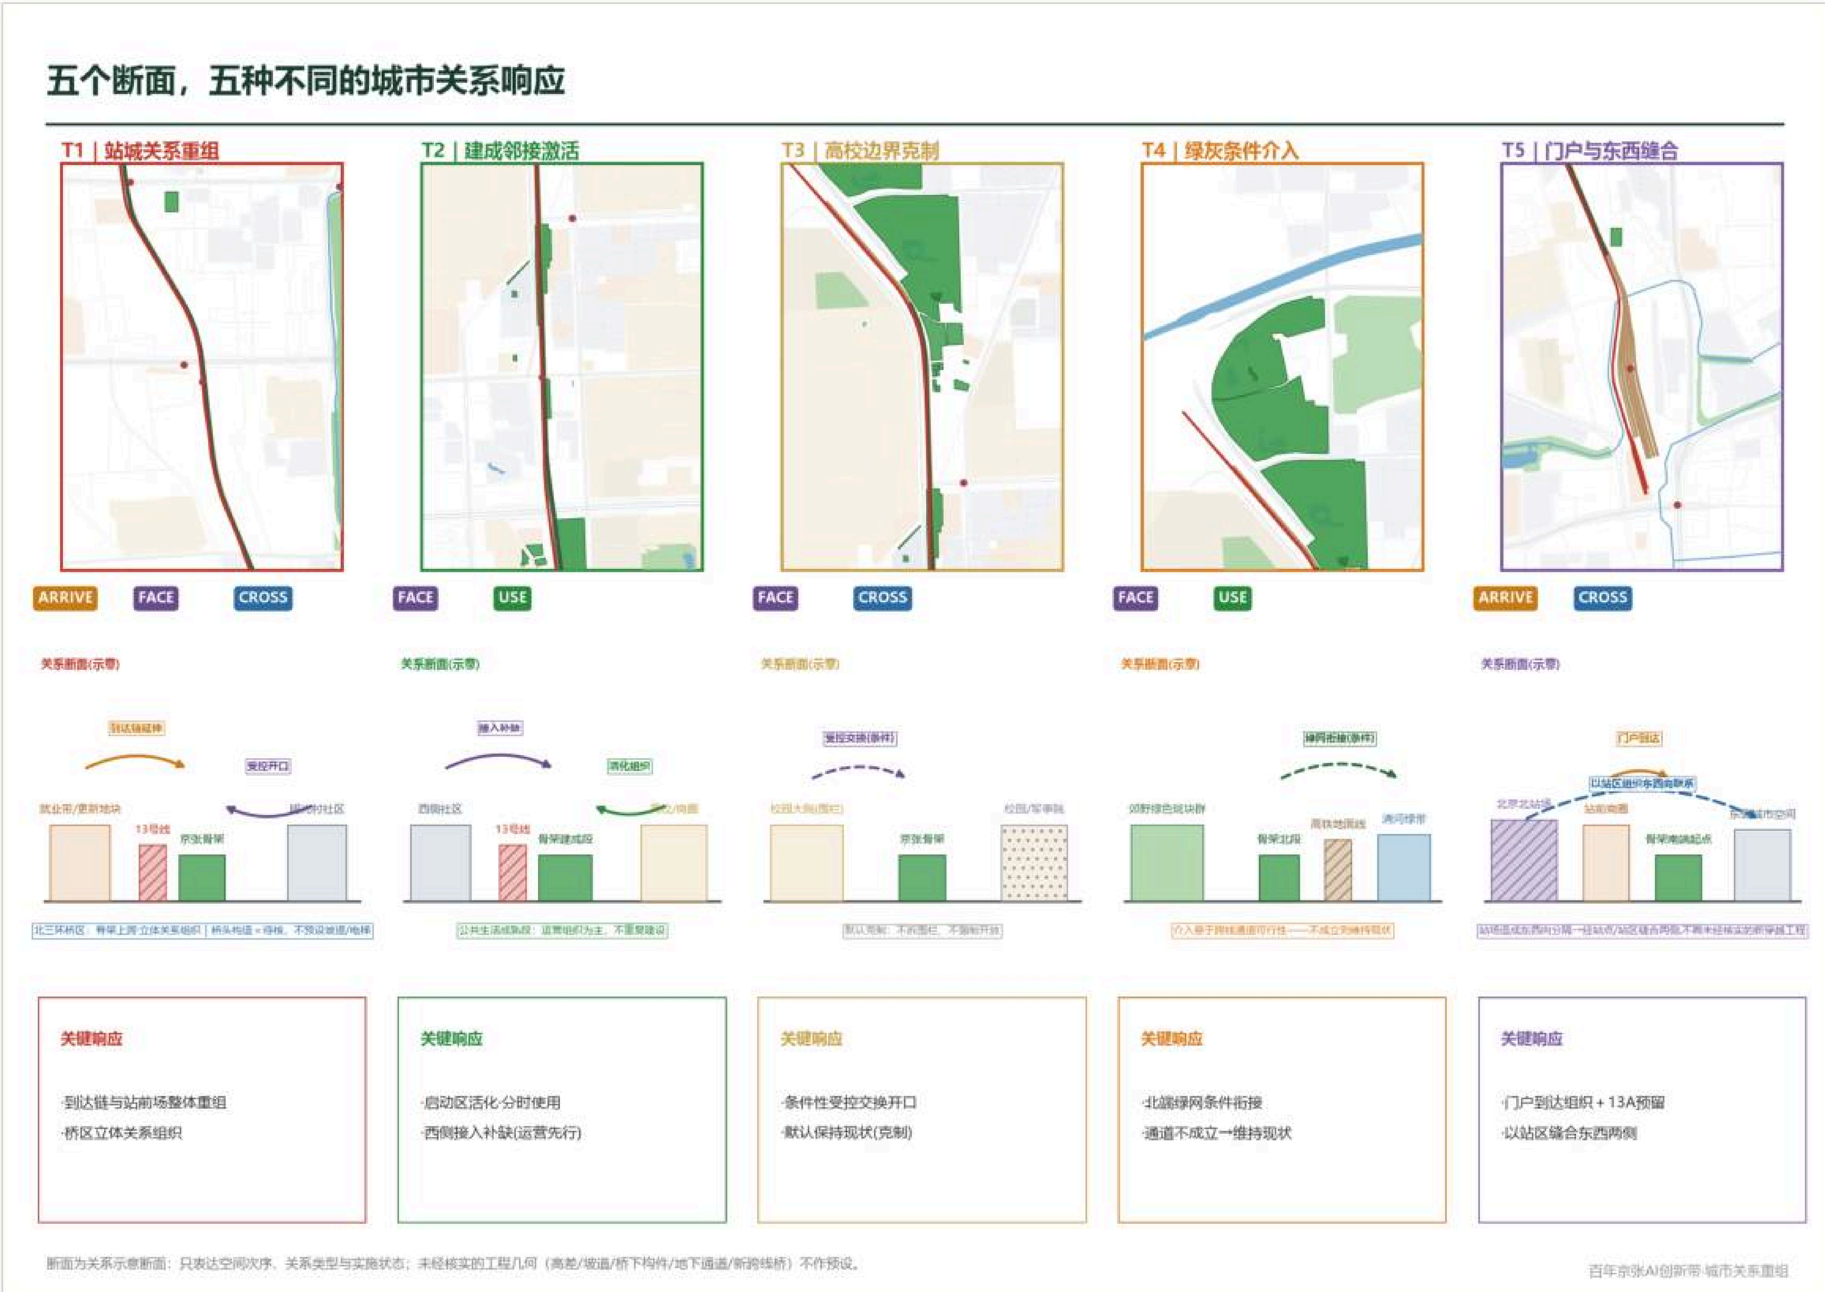
Data sources: this package's geometry/*.geojson and metrics.json; existing conditions from OpenStreetMap contributors under ODbL 1.0; provisional extent from brief/site-package/geometry/provisional_boundaries.geojson; design content from the entrant's own relation analysis. Areas recomputed in every spatial proposal is a conceptual recommendation, a reference scheme or material for a professional team to develop; the extent is a provisional rough boundary (official_boundary=false), not an official planning boundary, and cannot support approval or precise area claims; no government comm event, secured investment or committed construction is claimed.

Board 6 - AI scenarios, mechanisms, implementation and operation

All twelve scenario cards grow from existing spatial relations without new building complexes; three are industry testing scenarios, and all of them prohibit face recognition and individual tracking.



Four mechanisms by three modes: the nature and responsible party of every action



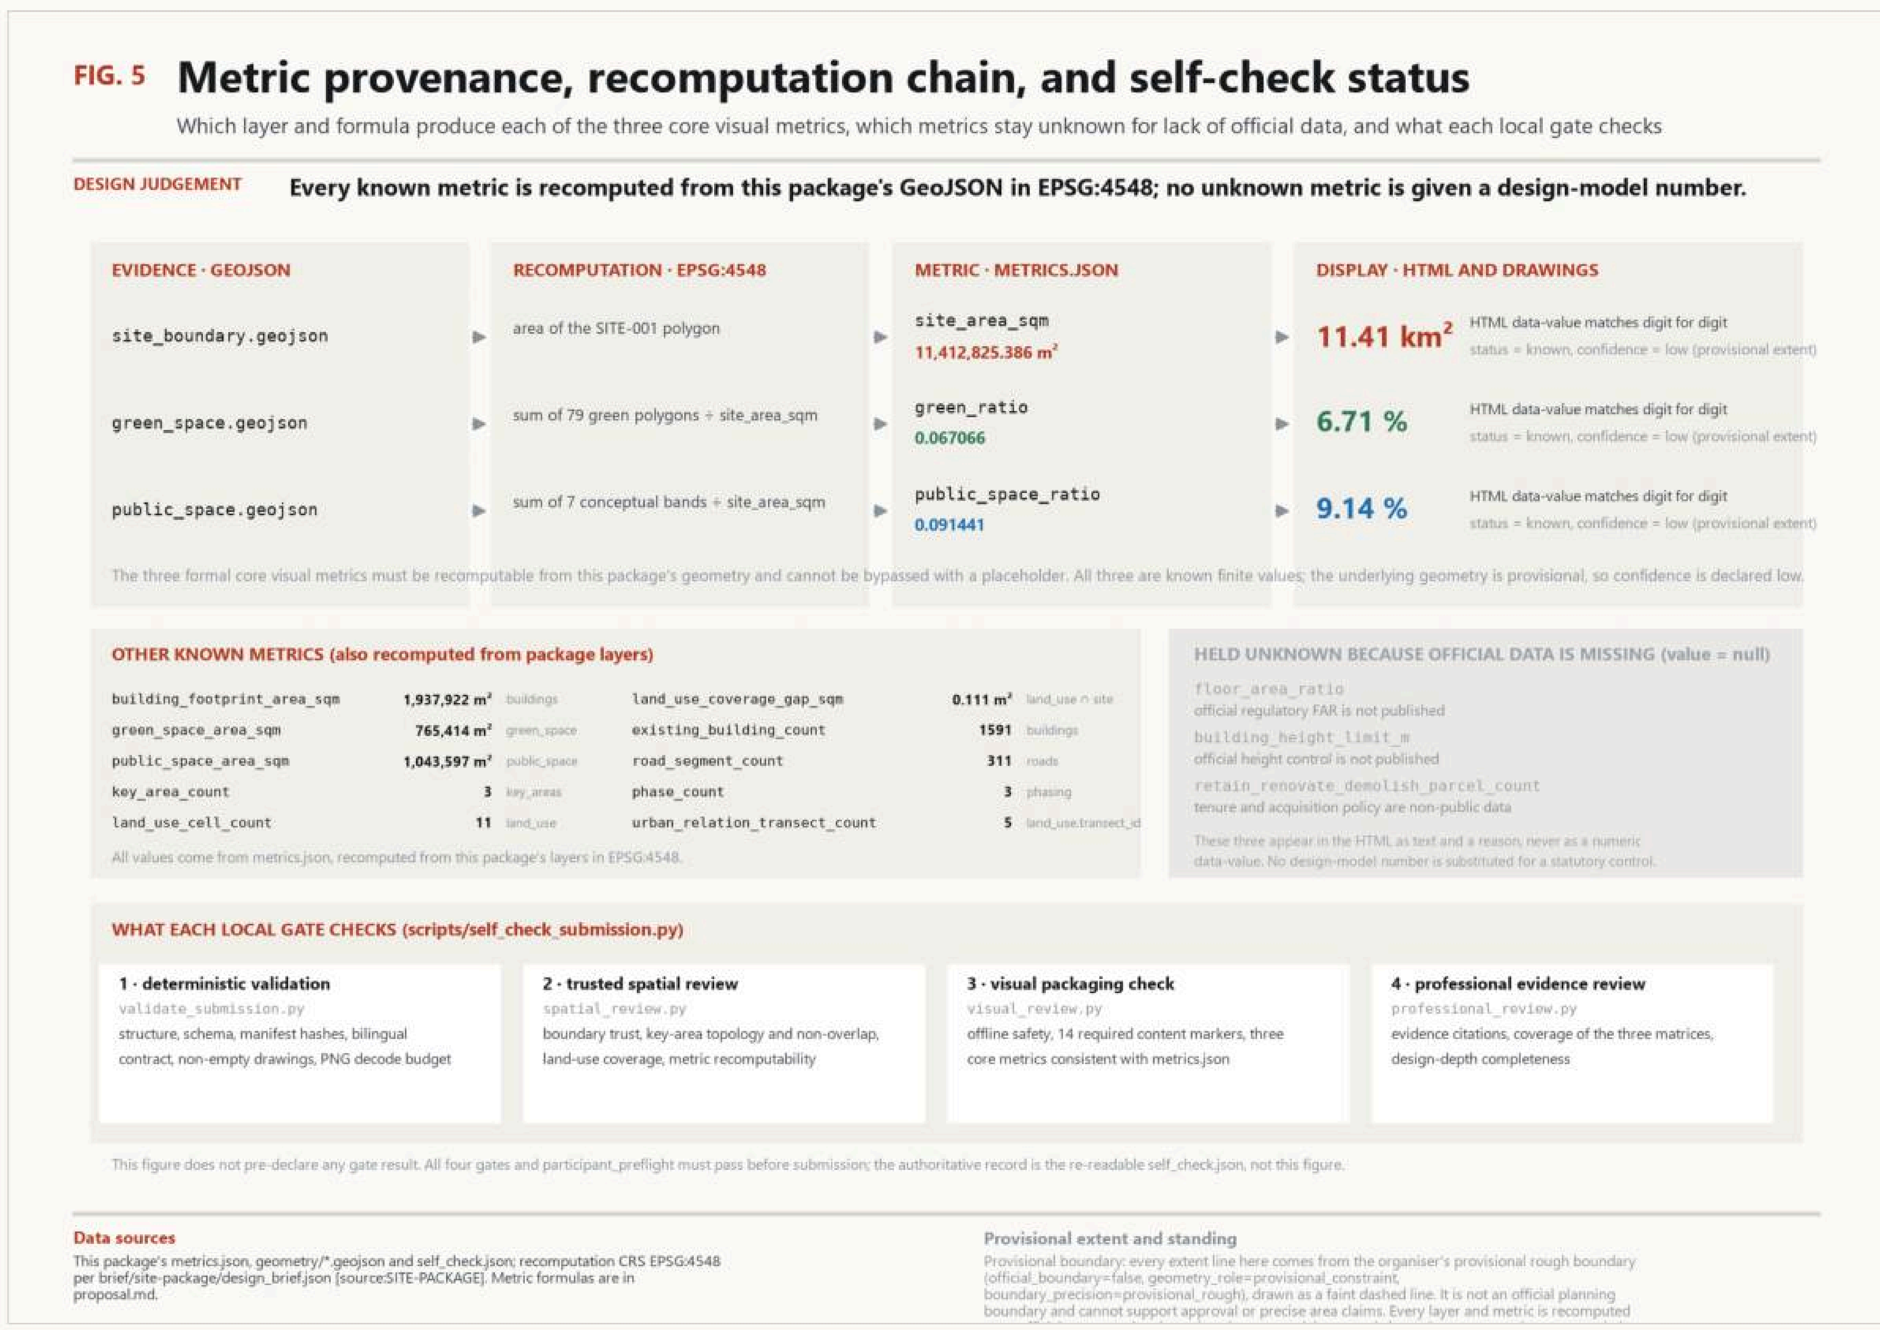
Five transects in three layers: plan strip, section and mechanism response

Research, translation and industry: the spatial basis of the AI innovation ecosystem

Data sources: this package's geometry/*.geojson and metrics.json; existing conditions from OpenStreetMap contributors under ODbL 1.0; provisional extent from brief/site-package/geometry/provisional_boundaries.geojson; design content from the entrant's own relation analysis. Areas recomputed in every spatial proposal is a conceptual recommendation, a reference scheme or material for a professional team to develop; the extent is a provisional rough boundary (official_boundary=false), not an official planning boundary, and cannot support approval or precise area claims; no government comm event, secured investment or committed construction is claimed.

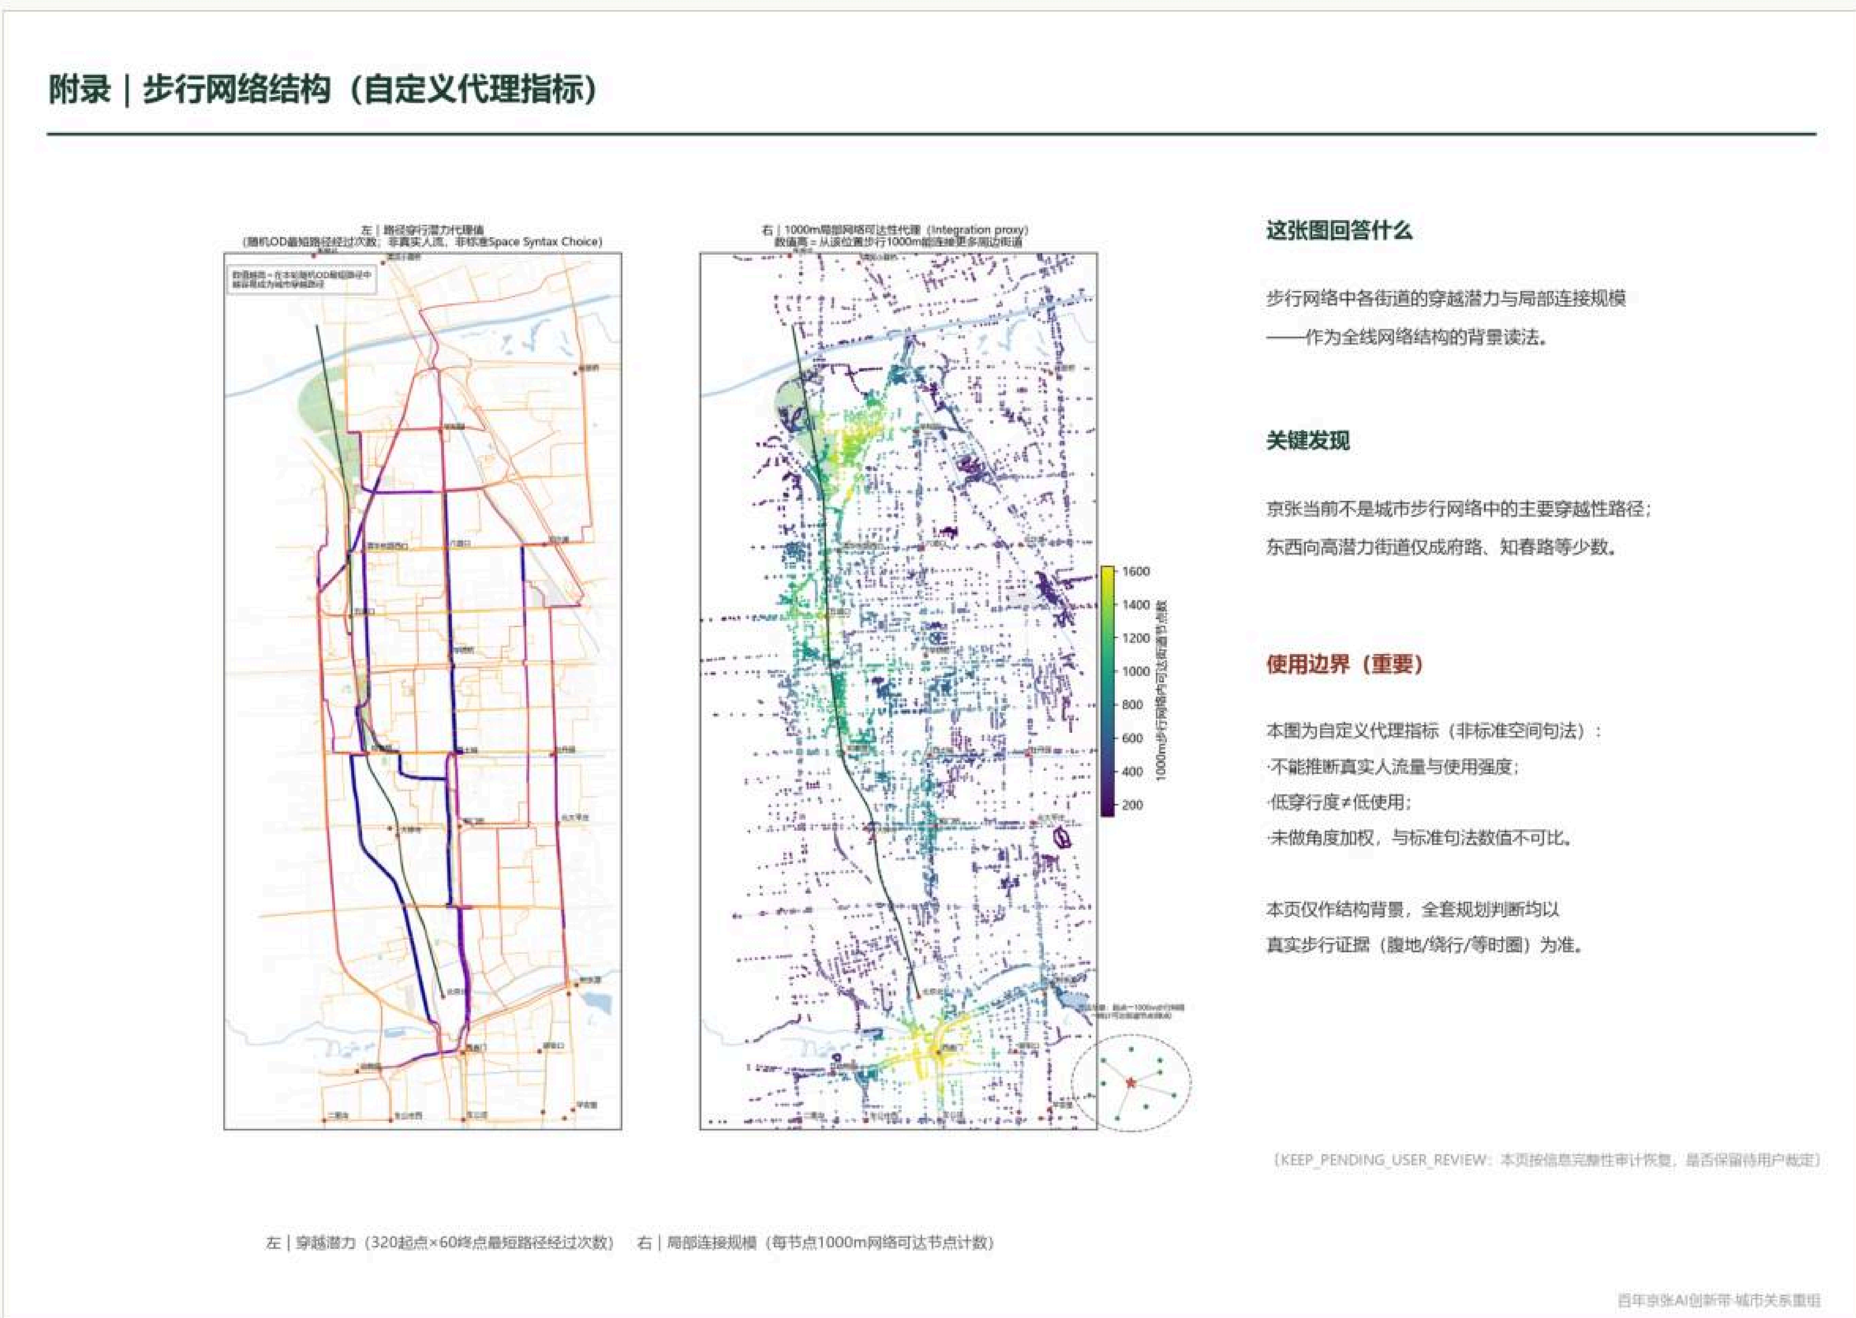
Board 7 - Metric verification and compliance response

Every known metric is recomputed programmatically from this package's GeoJSON in EPSG:4548; no unknown metric is given a design-model number.



Metric provenance, the recomputation chain and what each of the four local gates checks

Composite problem map: every conclusion traces back to an evidence board



Appendix: walking network structure, a proxy indicator with declared reduced weight
